Sales Return — Redesigned for Mobile / HHT

Same flow, same data, same dark Shiprocket WMS look — the scan box, both piles and Complete stay exactly where operators already expect them. Only the spacing, type scale and row layout are tightened for a narrow handheld screen.

REFERENCE Current Design (Desktop / Tablet Layout)

What's live today — built for a wide screen. Both piles render fully at once, stat tiles duplicate the pile counts, and Complete sits below the fold once a few AWBs are scanned.

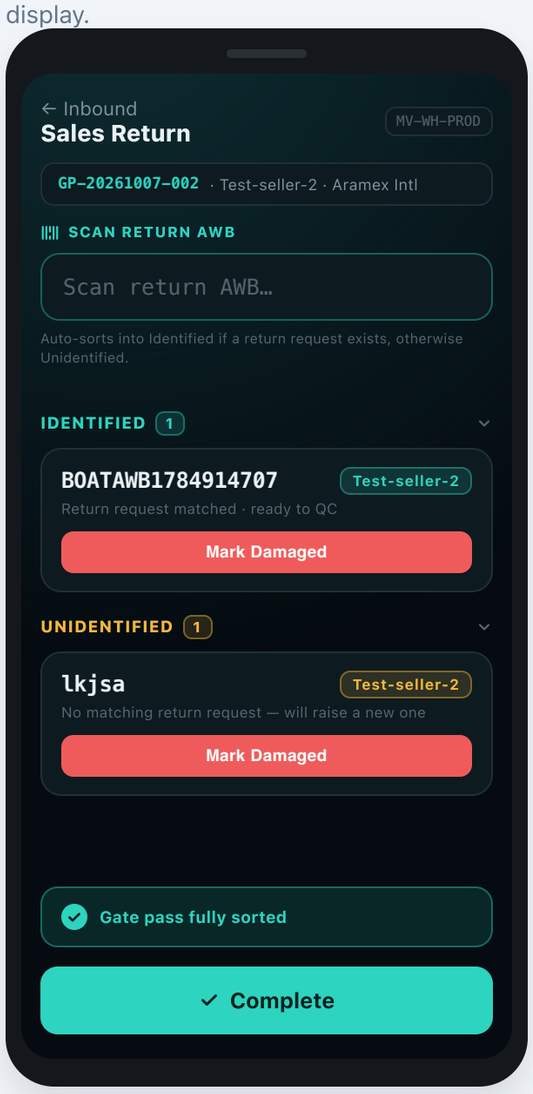

Pain points on a 3–4″ HHT screen

- **Redundant counts.** The IDENTIFIED / UNIDENTIFIED stat tiles repeat numbers already shown in each pile's header, eating a full row of screen height for no new information.
- **Complete can drop off-screen.** It's the most-tapped action at the end of a gate pass, but with two piles and a stat row ahead of it, it's pushed further from the thumb as more AWBs are scanned.
- **Mark Damaged competes with the AWB.** A small red pill sits inline with the scan code on every row, narrowing the tap target and crowding the primary "what did I just scan" information.
- **Gate pass context wraps.** Seller + courier + gate pass number sit to the right of the scan label and wrap awkwardly once the screen narrows below tablet width.

REDESIGN Mobile / HHT Flow — Same Theme, Tighter Layout

Same process as today, on the same screen: scan the gate pass context, scan each AWB, watch it land in Identified or Unidentified below, mark damage where needed, then Complete. Nothing is hidden behind tabs or gestures — only the density, type scale and row layout change to fit a 3–4″ HHT display.

What changed for a 3–4″ HHT screen

- **Both piles still stack below the scan box** — same order, same labels, same data as today. Nothing moved behind a tab or a swipe.
- **Counts moved into the pile headers** (IDENTIFIED 1) instead of a separate stat row, so the same information takes one line, not two.
- **Gate pass, seller and courier collapse into one strip** under the title, so they stop wrapping once the screen narrows below tablet width.
- **Mark Damaged is a full-width button under each row** instead of a small pill squeezed next to the AWB — easier to hit reliably on a handheld without mis-tapping the code.
- **Complete stays visible at the bottom** of the same screen the piles are on — no separate step, just tighter spacing above it so it doesn't get pushed past the fold as AWBs stack up.
